PROBLEM & SOLUTION

The Problem

Local merchants face slow hours and unpredictable demand patterns. Meanwhile, users ignore generic coupon apps because they're static, spammy, and poorly timed. The disconnect costs everyone.

The fix → ‘Coupify’

A "city wallet" delivering real-time, context-aware offers that nudge users only when timing is relevant. AI-driven ranking and notification system with offline fallback ensures smart, timely engagement.

System Overview

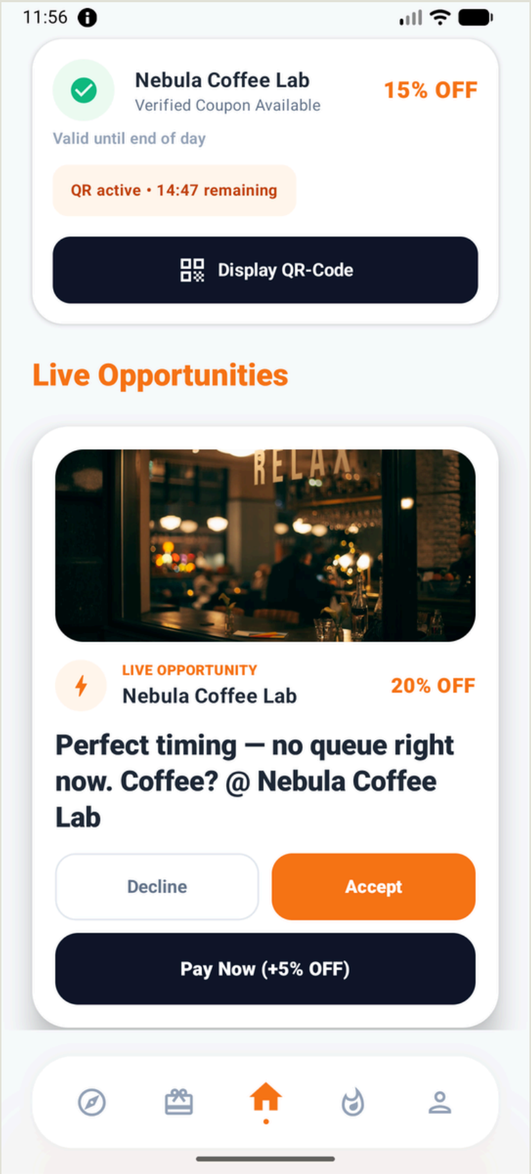
Technical architecture powering real-time, context-aware offers through seamless integration of mobile, backend, and AI components.

1
ANDROID APP
JETPACK COMPOSE

2
BACKEND API
FASTAPI + SQLALCHEMY

3
AI ENGINE
OLLAMA RANKING

4
DATA SIGNALS
WEATHER · TIME · LOCATION



Context Sensing Layer

Real-time context inputs feed into the backend, which builds a context bundle per request and applies boost rules (e.g., cold weather → coffee offers). Triggers: Home feed always generates offers; AI triggers max 1 notification/day per user.
